

Step — Install Ingress Controller

```
helm repo add ingress-nginx https://kubernetes.github.io/ingress-nginx
```

```
helm upgrade --install ingress-nginx ingress-nginx \
  --repo https://kubernetes.github.io/ingress-nginx \
  --namespace ingress-nginx \
  --create-namespace
# i create a Classic LB
```

Step — Verify Ingress Controller resources

The earlier step creates

- *ingress-nginx* namespace
- *ingress-controller* pod
- *ingress-nginx-controller* service
- *ingress-nginx-controller-admission* service (Validating admission controller which helps in preventing outages due to wrong ingress configuration)
- *EXTERNAL-IP* with a58xx.elb.amazonaws.com

Step — Create Deployment and Expose it as a service

```
# create deployment
```

```
kubectl create deployment demo --image=httpd --port=80
```

```
# expose deployment as a service
```

```
kubectl expose deployment demo
```

Step — Create Ingress resource to route request to demo service

```
kubectl create ingress demo --class=nginx \
```

```
--rule www.demo.io/=demo:80
```

```
curl - resolve www.demo.io:80:3.108.142.158 http://www.demo.io
```

Create NLB when installing Ingress Controller

```
# uninstall ingress controller
```

```
helm uninstall ingress-nginx -n ingress-ngins
```

```
# install ingress controller with NLB
```

```
helm upgrade --install ingress-nginx ingress-nginx --repo
```

```
https://kubernetes.github.io/ingress-nginx --namespace ingress-nginx
```

```
--create-namespace \
```

```
--set-string
```

```
controller.service.annotations."service\.beta\.kubernetes\.io/aws-load-balancer-type"="nlb"
```
